# HTML Tags

- Tag is a keyword encoded inside the angle bracket <>

- each tag makes one element or collection of elements

→ All tags in HTML, self closing tags, formating tags, interacting tags

- tags give elements their behaviour.

what is root element
child ele

**Block level** - always start with new line
- cant use another block level inside one blocklevel.
- It takes the full width of your screen.

Block level / inline

formating — interactive — media

www

self closing

- tags → elements → root container child → unpaired
  → semetic tags - non semetic
- Block level - formating - interacting - media (self / closing)
- Inline level - " " " "

Inline - it always starts with the same line.
- It takes the full width of your element/content.

~~5) Formatting~~

Elements:
- An HTML element is the building block of a webpage. It tells the browser what to display and how it behaves.

- Semantic tags: they are HTML elements that clearly describe the meaning of the element inside them, instead of using generic tags. ex: 
- They tell the developer and ~~user~~ browser what type of content it is.

- They improve readability, seo, and accessibility
- introduced in HTML5.

- They help search engines understand the page structure better.

- ~~self closing~~: semantic tags:

~~they~~ Ex: <Header>, <nav>, <section>, <aside>, <Footer>

All semantic tags are block level

self closing:

- they are tags that dont need a closing tag

ex: <html> ← this is a closing tag.

ex: <br>, <hr> etc.

closing tags:

they need closing tags.

ex: <html> </html>

non-semantic tags:

- They are , , ~~they~~
- They do not describe the meaning of content, they are used for styling and grouping. Browser does not understand what type of content is inside.
- They are generic containers.
- It has no seo, hard readability.

 blocklevel,  inline.

8 Formatting tags:
* It is used to style text.
9 Ex: bold <b> <i> italic etc

10 interactive:
they are used for user inputs and interaction
11 ex: <form>, <input> etc.

12 media:
